

Linear Regression

OLS
(Ordinary Least Square)
implemented in sklearn

SGD Regressor
(Gradient Descent approach)

Ordinary Least Square

Simple Linear Regression (one ^{input} feature / column)

$$\bar{y} = m\bar{x} + b$$

mean of target col.
mean of input col.

$$\Rightarrow b = (\bar{y} - m\bar{x})$$

and m can be calculated using the
loss fⁿ, Eqⁿ, $E = \sum_{i=1}^n (y_i - \hat{y}_i)^2$

$$E(m, b) = \sum (y_i - mx_i - b)^2$$

argmin of (m, b)

$$m = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2}$$

Eqⁿ ①

$$b = \bar{y} - m\bar{x}$$

Eqⁿ ②

Multiple Linear Regression

$$\hat{y}_1 = \beta_0 + \beta_1 x_{11} + \beta_2 x_{12} + \dots + \beta_m x_{1m}$$

$$\hat{y}_2 = \beta_0 + \beta_1 x_{21} + \beta_2 x_{22} + \dots + \beta_m x_{2m}$$

$$\vdots$$

$$\hat{y}_n = \beta_0 + \beta_1 x_{n1} + \beta_2 x_{n2} + \dots + \beta_m x_{nm}$$

$$\hat{\mathbf{y}} = \begin{bmatrix} \hat{y}_1 \\ \hat{y}_2 \\ \vdots \\ \hat{y}_n \end{bmatrix}_{n \times 1} = \begin{bmatrix} \beta_0 + \beta_1 x_{11} + \dots + \beta_m x_{1m} \\ \vdots \\ \beta_0 + \beta_1 x_{n1} + \dots + \beta_m x_{nm} \end{bmatrix}_{(n \times 1)} = \begin{bmatrix} 1 & x_{12} & \dots & x_{1m} \\ 1 & x_{22} & \dots & x_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & x_{n2} & \dots & x_{nm} \end{bmatrix}_{n \times (m+1)} \begin{bmatrix} \beta_0 \\ \beta_1 \\ \vdots \\ \beta_m \end{bmatrix}_{(m+1) \times 1}$$

$$\hat{\mathbf{y}} = \mathbf{X} \boldsymbol{\beta}$$

$$\text{loss, } E = \sum_{i=1}^n (y_i - \hat{y}_i)^2$$

$$= \mathbf{e}^T \mathbf{e} \quad \mathbf{e} = (\mathbf{y} - \hat{\mathbf{y}})$$

$$E = (\mathbf{y} - \hat{\mathbf{y}})^T (\mathbf{y} - \hat{\mathbf{y}})$$

$$= (\mathbf{y}^T - \hat{\mathbf{y}}^T) (\mathbf{y} - \hat{\mathbf{y}})$$

$$= \mathbf{y}^T \mathbf{y} - \mathbf{y}^T \hat{\mathbf{y}} - \hat{\mathbf{y}}^T \mathbf{y} + \hat{\mathbf{y}}^T \hat{\mathbf{y}}$$

$$E = \mathbf{y}^T \mathbf{y} - 2\mathbf{y}^T \hat{\mathbf{y}} + \hat{\mathbf{y}}^T \hat{\mathbf{y}}$$

$\mathbf{y}^T \hat{\mathbf{y}} \rightarrow \text{scalar}$ } always
 $\hat{\mathbf{y}}^T \mathbf{y} \rightarrow \text{scalar}$ } symmetric

$$E = \mathbf{y}^T \mathbf{y} - 2\mathbf{y}^T (\mathbf{X}\boldsymbol{\beta}) + (\mathbf{X}\boldsymbol{\beta})^T (\mathbf{X}\boldsymbol{\beta})$$

$$E(\boldsymbol{\beta}) = (\mathbf{y}^T \mathbf{y} - 2\mathbf{y}^T \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\beta}^T \mathbf{X}^T \mathbf{X} \boldsymbol{\beta}) \rightarrow \text{argmin } \boldsymbol{\beta}$$

$$\frac{\partial E}{\partial \boldsymbol{\beta}} = -2\mathbf{y}^T \mathbf{X} + 2\boldsymbol{\beta}^T \mathbf{X}^T \mathbf{X} = 0 \quad \left\{ \begin{array}{l} \frac{\partial}{\partial \boldsymbol{\beta}} (\boldsymbol{\beta}^T \mathbf{X}^T \mathbf{X} \boldsymbol{\beta}) = 2\mathbf{X}^T \mathbf{X} \\ \text{if } (\mathbf{X}^T \mathbf{X}) \rightarrow \text{symmetric} \end{array} \right.$$

Now, $\mathbf{y}^T \mathbf{X} = \boldsymbol{\beta}^T \mathbf{X}^T \mathbf{X}$

$$\mathbf{y}^T \mathbf{X} (\mathbf{X}^T \mathbf{X})^{-1} = \boldsymbol{\beta}^T$$

$$\boldsymbol{\beta} = \mathbf{X} (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

$$\boldsymbol{\beta} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

$$\left. \begin{array}{l} \mathbf{X} \rightarrow n \times (m+1) \\ \mathbf{y} \rightarrow n \times 1 \\ \boldsymbol{\beta} \rightarrow (m+1) \times 1 \end{array} \right\}$$

$$\hat{\mathbf{y}} = \mathbf{X} \boldsymbol{\beta} = \mathbf{X} (\beta_0, \beta_1, \dots, \beta_m)$$

$$= \beta_0 \mathbf{1} + \mathbf{X} \boldsymbol{\beta}'$$

$$\boldsymbol{\beta}' = \begin{bmatrix} \beta_1 \\ \beta_2 \\ \vdots \\ \beta_m \end{bmatrix}$$

$$\hat{\mathbf{y}} = \beta_0 + \mathbf{X} \boldsymbol{\beta}'$$

$$\left[\mathbf{y}^T \mathbf{X} (\mathbf{X}^T \mathbf{X})^{-1} \right]^T$$

$$= \left[(\mathbf{X}^T \mathbf{X})^{-1} \right]^T \mathbf{X}^T \mathbf{y}$$

$$= (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

$$= (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$
